

DDump

PHOTO CARD INGEST FOR MAC

DDump copies camera cards into safe local staging, groups files by shoot, moves them to your destination, verifies the copy, and handles retries so you can eject cards with less babysitting.

DOWNLOAD + INSTALL

1. Download DDump-0.3.0.dmg from the shared link or GitHub Releases.
2. Open the DMG, then double-click `Install DDump.command`.
3. Open `~/Applications/DDump.app`. If macOS asks, approve it in Privacy & Security.
4. Open Settings before the first real card and choose your destination.

FIRST SETUP

1. **General:** confirm staging is on a drive with plenty of free space.
2. **Destinations:** choose where finished imports should go.
3. **Naming:** use Smart, Calendar, Cluster, Sequential, or Custom names.
4. **Cloud:** leave off unless you want cloud uploads. Cloud setup is opt-in.
5. **Notifications:** choose macOS and/or ntfy alerts only for things you care about.

USING IT

1. Insert an SD card. DDump scans for recent photo/video files.
2. Approve/trust the card if DDump asks.
3. Watch the checklist: staging copy, eject, destination upload, verified done.
4. Optional: type a shoot name while transfer is running and click Use name.
5. Use Retry Pending Uploads if internet or destination storage was unavailable.

WHAT IT HANDLES

- Whole-card media detection, no DCIM-only requirement.
- Capture-time clustering for multiple shoots in one day.
- Calendar naming with native Google Calendar OAuth.
- Smart date folders like `2026/2026.06/2026.06.07`.
- Local staging receipts, pending upload recovery, and destination verification.

Best first test: use a small card or a test folder, confirm the destination folder appears, and check that DDump marks "All complete" before trusting it for paid work.

Need help? Open DDump, click **Log**, and send the newest lines plus a screenshot of the main window. Most issues are destination permissions, Google Drive availability, or a card that has not been trusted yet.
